DSF_quiz_02

Course: CSC461 - Data Science Fundamentals

CLO-3 Apply visualization and wrangling techniques to different types of datasets.

Q1. Given an unstructured dataset containing various text entries and timestamps, write a Python script that wrangles the data into structured format by extracting relevant information. The goal is to create two columns 'Timestamp' (in ISO 8601 date-time standard) for when events occurred within each entry timestamp range of one hour.

Answer:

```
Algorithm: First, parse the dataset into a DataFrame using pandas library with timestamps as
index. Then apply resampling method to group data by hours and extract unique entries per time
stamp in ISO 86ner format.
```
