ANSWER KEY

Programming_Fundamentals_Quiz_01

Course: CSC103 - Programming fundamental

CLO-1 Explain the fundamental concepts of programming.

Q1. Write an algorithm to reverse a string.

Answer:

```
Algorithm:
1. Initialize the reversedString as empty.
2. Loop through each character in inputStr from end to start, appending it into reversedString
at every iteration: for i = length(inputStr) - 1 downto 0 do
exit loop when all characters are processed and return or print out 'reversedString'.
```

Marks: 5

Q2. Develop pseudo code for sorting the elements of any given array in ascending order using a selection sort algorithm.

Answer:

```
Algorithm:
1. Start with an unsorted list.
2. Find the smallest element (min) from the current sublist and swap it to be at index 0 if
not already there, then reduce your search range by one position on both ends of array for
next iteration
3. Repeat step two until you reach end-of-array marker where no swaps are needed.
4. The list is now sorted in ascending order.
```
