ANSWER KEY

STATS_Quiz_1

Course: DS-001 - Probability & Statistics for Data Science

CLO-1 Define basic concepts of probability, random variables, and statistical measures

Q1. Define the term 'random variable' in probability theory.

Answer:

A random variable is a quantifiable outcome of an uncertain event or experiment, which can take on different values based on the result of that uncertainty. In probability theory and statistics, it'ries used to model numerical outcomes such as dice rolls (e.g., rolling a six), coin flips (heads or tails), or survey responses.
